

# wellcare® information for you about Your Septic System

More than 43 million people depend on private well systems for drinking water and other uses. Approximately 20 percent of U.S. households rely on onsite wastewater systems to dispose of waste water on their property. Homeowners with both wells and septic systems must take care to maintain these systems in order to insure the purity of their drinking water.

## How Septic Systems Work

A septic system is a highly efficient, self-contained, underground wastewater treatment system. The following is a description of how septic systems work:

**A septic system consists of two main parts** – a **septic tank** and a **drainfield**. The septic tank is a watertight box, usually made of concrete or fiberglass, with an inlet and outlet pipe. Wastewater flows from your home to the septic tank through the sewer pipe.

The septic tank treats the wastewater naturally by holding it in the tank long enough for solids and liquids to separate. The wastewater forms three layers inside the tank. Solids lighter than water (such as greases and oils) float to the top, forming a layer of scum. Solids heavier than water settle at the bottom of the tank, forming a layer of sludge. This leaves a middle layer of partially clarified wastewater.

The layers of sludge and scum remain in the septic tank where bacteria found naturally in the wastewater work to break down the solids. The sludge and scum that cannot be broken down are retained in the tank until the tank is pumped. The layer of clarified liquid flows from the septic tank to the drainfield or to a distribution device, which helps to uniformly distribute the wastewater in the drainfield.

A standard drainfield (also known as a leachfield, disposal field, or a soil absorption system) is a series of trenches or a bed lined with gravel or coarse sand and buried one to three feet below the ground surface. Perforated pipes or drain tiles run through the trenches to distribute the wastewater. The drainfield treats the wastewater by allowing it to slowly trickle from the pipes out into the gravel and down through the soil. The gravel and soil act as biological filters.

## Installing a Septic System

A septic system must be installed a minimum safe distance away from drinking water wells, streams, lakes and houses, in order to protect water quality from wastewater working through the system. Distances are established both horizontally, which applies across the surrounding landscape and protects surface water, and vertically, which applies to distances underground and protects ground water.

State and local health departments set the minimum distance standards. The U.S. Environmental Protection Agency recommends a minimum of 50 feet between your well and your septic tank or septic tank leach field. Check with your water systems professional, septic tank service or local health department for standards in your area.

If you buy a property on which the septic system does not meet minimum separation standards, test your drinking water for bacteria at least twice a year.

## Managing Your Septic System

A properly maintained septic system is no threat to the groundwater that supplies your well. However, if your septic system is failing, wastewater can carry contaminants such as nitrates, harmful bacteria, and viruses into ground water and, potentially, the well.

Your septic system, just like your drinking water well system, needs a regularly scheduled maintenance program. Create a septic maintenance log and keep it with your well maintenance log. It is recommended to have your septic system inspected by a professional every 1-2 years and to have the septic tank pumped out when needed, generally every 3 to 5 years, depending on the demand placed on it.

Demand is based upon the number of people in your household, the amount of wastewater generated (based on the number of people in the household and the amount of water used), the volume of solids in the wastewater (e.g., using a garbage disposal will increase the amount of solids), and septic tank size. The use of water conservation devices can also limit the amount of wastewater, and prolong the life of your septic system.

Make sure that everyone in the household is careful about what they flush down your sinks or toilets. Never dispose of items that can clog the system or chemicals that could contaminate ground and surface water. This includes grease, fat, oil, gauze bandages, feminine hygiene products, disposable diapers, paper towels, kitty litter, cigarette butts, coffee grounds, dental floss, hair, paint, pesticides, varnish, thinners, waste oil, and photographic solutions.

Also take care of your septic system's drainfield. The following strategies will help to protect the field and prolong its functional life:

- Do not drive over the drainfield with cars, trucks or heavy equipment.
- Do not plant trees or shrubbery in the drainfield area. The roots can get into the lines and plug them.
- Do not cover the drainfield with hard surfaces, such as concrete or asphalt. Grass is the best cover because it will help prevent erosion and help remove excess water.
- Divert surface runoff water from roofs, patios, driveways and other areas away from the drainfield.

---

## For more information to help you maintain your well and protect your water supply

**wellcare®** is a program of the **Water Systems Council** (WSC). WSC is the only national organization solely focused on protecting the health and water supply of the 43 million people nationwide who depend on household wells for their water supply.

This publication is one in a series of **wellcare®** information sheets. There are more than 90 available FREE on the WSC website at [www.watersystemscouncil.org](http://www.watersystemscouncil.org).

Well owners and others with questions about wells or groundwater can also contact the FREE **wellcare®** Hotline at 1-888-395-1033 or visit [www.wellcarehotline.org](http://www.wellcarehotline.org)

**JOIN THE WELLCARE® WELL OWNERS NETWORK! You can join the well owners network and receive regular information on how to maintain your well and protect your well water...it's FREE!**
